	Examiner	Art Unit
	Jung W Kim	2132

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) Responsive to communication(s) filed on _____.
- 2a) This action is **FINAL**. 2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) Claim(s) _____ is/are allowed.
- 6) Claim(s) 1-20 is/are rejected.
- 7) Claim(s) _____ is/are objected to.
- 8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on 13 July 2001 is/are: a) accepted or b) objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
 - a) All b) Some * c) None of:
 1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) <input checked="" type="checkbox"/> Notice of References Cited (PTO-892)	4) <input type="checkbox"/> Interview Summary (PTO-413)
2) <input type="checkbox"/> Notice of Draftsperson's Patent Drawing Review (PTO-948)	Paper No(s)/Mail Date. _____
3) <input checked="" type="checkbox"/> Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08) Paper No(s)/Mail Date <u>4 and 7</u> .	5) <input type="checkbox"/> Notice of Informal Patent Application (PTO-152)
	6) <input type="checkbox"/> Other: _____

Detailed Action

1. The Preliminary Amendment filed on January 7, 2002 has been entered.

Claims 1-20 have been examined.

Specification

2. The disclosure is objected to because of the following informalities: on page 4, line 14, an indefinite article is missing. Appropriate correction is required.

Claim Objections

3. Claim 20 is objected to because of the following informalities: the phrase "varies over continuously over time" should read "varies continuously over time". Appropriate correction is required.

Claim Rejections - 35 USC § 112

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
5. Claim 12 is rejected under 35 U.S.C. 112, second paragraph, as being incomplete for omitting essential structural cooperative relationships of elements, such omission amounting to a gap between the necessary structural connections. See MPEP § 2172.01. The omitted structural cooperative relationships are: the structural relationship between the memory (see line 2) and

the logic to perform a stream cipher using an encryption key on input data segmented in random sized blocks (see lines 3-5).

Double Patenting

6. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

7. Claims 1-8, 12-14, and 17-19 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-8, 15-20, 22 and 25 of copending Application No. 09,864,042. Although the conflicting claims are not identical, they are not patentably distinct from each other because both sets of claims define a cipher comprising a routine to divide incoming plain text into variable-sized blocks and a routine converting the plain text into cipher text based on an encryption key and an internal identifier. The additional limitation of an internal state affecting the conversion routine defined in the aforementioned claims of the instant application does not

define a patentably distinct limitation since it is an inherent feature of a ciphering device.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 103

8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

9. Claims 12-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Coppersmith et al. U.S. Patent No. 6,243,470 (hereinafter Coppersmith) and Ritter U.S. Patent No. 5,727,062 (hereinafter Ritter).

10. As per claim 12, Coppersmith discloses a computing device comprising:

a. a memory (see Coppersmith, Figure 1, Reference No. 28); and
b. logic to perform a state-varying stream cipher operation, controlled by at least an encryption key and an internal state of the computing device, on input data segmented blocks (see Coppersmith, Abstract).

11. Coppersmith does not expressly disclose the input data as being segmented into random sized blocks. Ritter teaches a cipher wherein the block size is dynamically variable during operation (see Ritter, col. 11, lines 64-67). It

would be obvious to one of ordinary skill in the art at the time the invention was made to apply the teaching of Ritter to the cipher taught by Coppersmith.

Motivation for such an implementation, inter alia, include: a variable block size cipher to better fit to existing systems, to better fit to variable size devices and to potentially eliminate expansion data. See Ritter, col. 7, lines 28-63; col. 9, lines 5-14. The aforementioned covers claim 12.

12. As per claim 13, Coppersmith covers a computer device as outlined above in the claim 12 rejection under 35 U.S.C. 103(a). In addition, the stream cipher operation involves encryption. See Coppersmith, Abstract. The aforementioned covers claim 13.

13. As per claim 14, Coppersmith covers a computer device as outlined above in the claim 12 rejection under 35 U.S.C. 103(a). In addition, the logic is an integrated circuit. See Coppersmith, col. 6, lines 20-24. The aforementioned covers claim 14.

14. As per claims 15 and 16, Coppersmith covers a computer device as outlined above in the claim 12 rejection under 35 U.S.C. 103(a). In addition, the internal state of the computing device varies over time and the variation of the internal state of the computing device is periodic being set at a time that an encryption process begins for each block of input data. See Coppersmith,

Abstract; col. 20, line 44-col. 23, line 50, 'sub-key generation'. The aforementioned cover claims 15 and 16.

15. As per claims 17, Coppersmith covers a computer device as outlined above in the claim 12 rejection under 35 U.S.C. 103(a). In addition, the computing device is a smart card. See Coppersmith, col. 3, lines 37-41. Further, smart cards are secure portable devices, wherein the actuation of the device is restricted to authorized operations. The aforementioned covers claim 17.

16. As per claim 18, Coppersmith covers a computer device as outlined above in the claim 15 rejection under 35 U.S.C. 103(a). In addition, the computing device is an operating system. See Coppersmith, Figures 1 and 2, and claim 16. The aforementioned covers claim 18.

17. Claims 1-3, 9 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Coppersmith in view of Ritter, and further in view of Reardon U.S. Patent No. 6,212,635 (hereinafter Reardon).

18. As per claim 1, Coppersmith covers a state-varying hybrid cipher operating within a computing device as outlined above in the claim 15 rejection under 35 U.S.C. 103(a). For the reasons argued above, the cipher comprises:

- a. a first software routine to divide incoming plain text into variable-sized blocks (see Coppersmith, col. 7, lines 33-43; col. 7, line 57-col. 8,

Art Unit: 2132

line 3; see Ritter, col. 11, lines 64-67; col. 7, lines 28-63; col. 9, lines 5-14); and

b. a second software routine to convert the plain text into cipher text based on an encryption key and an internal state of the computing device (see Coppersmith, col. 7, line 45-col. 11, line 42; col. 20, line 44-col. 23, line 50: the sub-key (internal state) is set for each round).

19. Coppersmith does not expressly teach using an encryption key and an internal identifier to encrypt the plain text. However, use of an identifier in addition to an encryption key to encipher a plain text is a common feature in the art to uniquely associate a cipher text to an encrypting device. For example, Reardon teaches incorporating user and system identification profile information as seed values into a one-way hash function to generate an encryption key. See Reardon, col. 10, lines 40-59. It would be obvious to one of ordinary skill in the art at the time the invention was made for the plain text to be encrypted using an encryption key and an internal identifier to create a cipher text unique to the device profile as taught by Reardon. Ibid. The aforementioned covers claim 1.

20. As per claims 2 and 3, Coppersmith covers a cipher as outlined above in the claim 1 rejection under 35 U.S.C. 103(a).

21. Coppersmith does not teach generating a value for the block size from a second non-linear function based on the encryption key and the internal identifier. However, as argued above, Coppersmith teaches block size as an adjustable variable and that randomization of block size enables a more secure

cipher. See Coppersmith, col. 2, lines 51-53; col. 7, lines 37-38. Further, Ritter teaches block size as a dynamic variable that varies over the course of transmitted data to enable a more adaptable cipher. See Ritter, col. 7, lines 28-63; col. 9, lines 5-14. Moreover, Reardon teaches combining multiple seeds unique to a device (encryption key and internal identifier operate as values unique to an encrypting device) to generate a unique value specific to the device by means of a second non-linear function (a one-way hash function). See Reardon, col. 10, lines 40-59. Hence, it would be obvious to one of ordinary skill in the art at the time the invention was made for the block size to be generated from a second non-linear function seeded with values unique to the cipher device to generate a unique random block size, but deterministic based on values unique to the cipher device as taught by Coppersmith, Ritter and Reardon. Ibid.

22. Further, Coppersmith does not teach using the output of a first non-linear function as a third parameter seed to the second non-linear function to generate the block size. However, non-linear functions are the basic functions for generating cryptographic pseudo-random variables (as before, one-way hash functions); moreover, the nature of pseudo-random values ensures these values are most likely secure from all attacks except for brute-force methods and hence, effectively secure from unscrupulous third parties. Finally, a pseudo-random value as a seed for a non-linear function introduces another randomizing element into the block size generator to make for a more secure encryption system.

Examiner takes Official Notice of these teachings. It would be obvious to one of ordinary skill in the art at the time the invention was made for the block size to be

further determined based on a first non-linear function since the block size would be based on a pseudo-random value and hence harder to ascertain as known to one of ordinary skill in the art. The aforementioned cover claims 2 and 3.

23. As per claim 9, Coppersmith covers a cipher as outlined above in the claim 1 rejection under 35 U.S.C. 103(a). Although Coppersmith does not expressly teach a routine distributing error correcting codes in the cipher text in order to correct modifications, error correcting codes are well known features in the art of networking to identify and correct errors occurring to digital data during transmission. Some examples are: parity, checksums and CRC. Examiner takes Official Notice of this teaching. It would be obvious to one of ordinary skill in the art at the time the invention was made for a third software routine to distribute error correcting codes in the cipher text in order to correct modifications as known to one of ordinary skill in the art. The aforementioned covers claim 9.

24. As per claim 10, Coppersmith covers a cipher as outlined above in the claim 1 rejection under 35 U.S.C. 103(a). In addition, the internal state of the computing device is periodically modified. See Coppersmith, Abstract; col. 20, line 44-col. 23, line 51. The aforementioned covers claim 10.

25. Claims 4, 5, 7, 8, 19 and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Coppersmith in view of Ritter and Reardon, and further in view of Moskowitz et al. U.S. Patent No. 5,822,432 (hereinafter Moskowitz).

26. As per claim 4, Coppersmith covers a cipher as outlined above in the claim 1 rejection under 35 U.S.C. 103(a).
27. Coppersmith does not disclose a third software routine to determine if a plurality of random data elements are to be distributed within the cipher text. Moskowitz teaches a method of inserting random values into a digital stream (watermarking the data), which are based on human interactive input information, by mapping these values into the digital stream wherein a key is used to identify the locations of the random values. See Moskowitz, claims 1 and 4; Figure 1. It would be obvious to one of ordinary skill in the art at the time the invention was made for the cipher to include a third software routine to determine if a plurality of random data elements are to be distributed within the cipher text. Motivation for such an implementation enables the cipher to insert a watermark contingent on input by a user. See Moskowitz, col. 2, lines 31-55.
28. Further, Coppersmith does not expressly disclose computing a hash digest of the random data elements. However, it is well-known in the art that hash digests are used to fingerprint digital data to allow for future validation of its authenticity. Moreover, security features to ensure the integrity of watermarks are an essential step to maintain the validity of a watermark, and hence the authenticity of the digital data. Examiner takes Official Notice of these teachings. It would be obvious to one of ordinary skill in the art at the time the invention was made for the output stream to include a hash digest to enable future verification

Art Unit: 2132

of the authenticity of the digital data as known to one of ordinary skill in the art.

The aforementioned covers claim 4.

29. As per claim 5, Coppersmith covers a cipher as outlined above in the claim 4 rejection under 35 U.S.C. 103(a).

30. In addition, the fourth software routine further performs a first shuffling operation on the internal state of the computing device based on the encryption key so that a single bit modification of the encryption key requires complete recalculation of the internal state of the computing device. See Coppersmith, Figure 5B, Reference No. 610 and related text. The aforementioned covers claim 5.

31. As per claim 7, Coppersmith covers a cipher as outlined above in the claim 4 rejection under 35 U.S.C. 103(a).

32. In addition, Moskowitz discloses that the third software routine determines a statistical amount of random data elements distributed within the cipher text is programmable based on a percentage value entered by a user. See Moskowitz, claim 4. It would be obvious to one of ordinary skill in the art at the time the invention was made for the third software routine to determine an amount of random data elements distributed within the cipher text to be programmable based on a percentage value entered by a user to enable the user to minimize the footprint while maximize the security of the watermark. See Moskowitz, col. 1, lines 46-51. The aforementioned covers claim 7.

33. As per claim 8, Coppersmith covers a cipher as outlined above in the claim 7 rejection under 35 U.S.C. 103(a).

34. Coppersmith does not disclose that the amount of random data elements distributed within the cipher text is based on the encryption key, the internal identifier and the internal state of the hybrid stream cipher. However, Coppersmith does teach randomizing parameters of a cipher to thwart an observer from discovering the original contents of a cipher text. See Coppersmith, col. 2, lines 51-53. Since the randomization must be deterministic to enable an inverse operation, or at least identify the locations of these random data values in the digital stream, the randomization sequence must be based on values corresponding to the known state of the cipher when the amount of random data elements was initially determined. Hence, values such as the encryption key, the internal identifier and the internal state of the computing device are obvious seeds to generate the amount of random data elements to be distributed within the cipher text. It would be obvious to one of ordinary skill in the art at the time the invention was made for the amount of random data elements distributed within the cipher text to be based on the encryption key, the internal identifier and the internal state of the hybrid stream cipher to automatically generate a random but deterministic value as known to one of ordinary skill in the art. The aforementioned covers claim 8.

Art Unit: 2132

35. As per claim 19, Coppersmith covers a method as outlined above in the claim 7 rejection under 35 U.S.C. 103(a). In addition, since the method is a symmetric key cipher, a decryption method utilizes the same key and the results of its own earlier iterations to randomize the transformation of data. See Coppersmith, Abstract; col. 6, lines 46-59. The aforementioned covers claim 19.

36. As per claim 20, Coppersmith covers a method as outlined above in the claim 19 rejection under 35 U.S.C. 103(a). In addition, the internal state of the computing device varies continuously over time. See Coppersmith, Abstract; col. 20, line 44-col. 23, line 50, 'sub-key generation'. The aforementioned covers claim 20.

37. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Coppersmith in view of Ritter, Reardon and Moskowitz, and further in view of Fielder et al. U.S. Patent No. 5,963,646 (hereinafter Fielder).

38. As per claim 6, Coppersmith covers a cipher as outlined above in the claim 5 rejection under 35 U.S.C. 103(a).

39. In addition, as outlined above, Coppersmith teaches initializing the internal state of the computing device based on at least an internal identifier, but does not teach a second shuffling operation on the internal state of the computing device based on at least the internal identifier. Fielder teaches shuffling internal identifiers to generate a cipher key, which is used to encrypt a plain text. See

Fielder, Figure 2, Reference No. 52. It would be obvious to one of ordinary skill in the art at the time the invention was made for a second software routine to perform a second shuffling operation on the internal state of the computing device based on at least the internal identifier to resist cryptographic analysis. See Fielder, col. 3, lines 1-6. The aforementioned covers claim 6.

40. Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Coppersmith in view of Ritter and Reardon, and further in view of Stallings, Cryptography and Network Security (hereinafter Stallings). As per claim 11, Coppersmith covers a cipher as outlined above in the claim 1 rejection under 35 U.S.C. 103(a). Coppersmith does not teach basing the internal state of the computing device on a time value. Stallings teaches incorporating time values into digital data as a means to assure the freshness of a transmitted digital message. See Stallings, page 304, 5th bullet. A broader view of this teaching links an event and/or data to a unique time value. Further, as mentioned above, Reardon teaches incorporation seeds to uniquely identify the generated key with the profile of the user/system at the time of key generation. It would be obvious to one of ordinary skill in the art at the time the invention was made for the internal state of the computing device to be based on a time value. Motivation for such a combination enables the internal state to be based on a specific time relevant to the generation of the cipher text as known to one of ordinary skill in the art.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Coppersmith U.S. Patent No. 6,192,129.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jung W Kim whose telephone number is (703) 305-8289. The examiner can normally be reached on M-F 9:00-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gilberto Barron can be reached on (703) 305-1830. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
